

1. Software Testing

Running the software to check whether it works correctly and meets the user's expectations.

2. Importance of Testing

- Catching bugs before they reach the users
- Saving time and cost
- Ensuring the product's quality and reliability
- Maintaining the client's/user's trust

3. SDLC (Software Development Life Cycle)

The complete process of building software, from planning to maintenance.

Phases: Requirement Gathering → Planning → Design → Development → Testing → Deployment → Maintenance

4. STLC (Software Testing Life Cycle)

The part of SDLC that focuses only on testing.

Phases: Requirement Analysis → Test Planning → Test Case Development → Environment Setup → Test Execution → Test Cycle Closure

5. SDLC vs STLC

SDLC is the process for the entire software development (includes both development and testing), while STLC is the process for testing only — it is a smaller part within SDLC.
